     Embedded systems contain several layers of target processing abstraction. These layers
     include electronic circuit, binary machine code, mnemonic assembly code, and high-level
     procedural and object-oriented abstractions. Physical and temporal constraints and
     artifacts within physically embedded systems make it impossible for software engineers to
     operate at a single layer of processor abstraction. The Luxdbg embedded system
     debugger exposes these layers to debugger users, and it adds an additi ...
